Hello there, friend. I'm excited to help you on your fitness journey.

First, let's calculate your BMI (Body Mass Index) to get an idea of your current health status. Based on your height (170 cm) and weight (85 kg), your BMI is approximately 29.4, which falls into the overweight category.

Don't worry, we can work together to create a plan that suits your lifestyle and goals. To get started, I have a few questions:

1. What are your fitness goals? Do you want to lose weight, build muscle, increase endurance, or improve overall health?
2. How many days a week can you dedicate to working out?
3. Do you have any preferred type of exercise or activities (e.g., running, swimming, weightlifting, yoga)?
4. Do you have access to a gym or would you prefer home workouts?

What should I eat before a workout?

AI

Great question! Eating the right foods before a workout can give you the energy you need to power through your session. Here are some general tips:

1. **Timing:** Try to eat your pre-workout meal or snack 1-3 hours before exercising. This gives your body time to digest and absorb the nutrients.
2. **Carbohydrates:** Carbs are your body's preferred source of quick energy. Opt for complex carbs like whole grains, fruits, and vegetables, which provide sustained energy.
3. **Protein:** Including some protein can help prevent muscle breakdown during your workout and aid in recovery afterwards. Good sources include lean meats, dairy, eggs, or plant-based options like beans and tofu.
4. **Healthy Fats:** While fats take longer to digest, including a small amount can help keep you feeling full and satisfied. Avocados, nuts, seeds, and olive oil are great options.
5. **Hydration:** Don't forget to drink water! Aim to stay hydrated throughout the day leading up to your workout.

Here are a few simple pre-workout meal ideas:
